SUMMARY

Computer Science graduate building Go services and running them on Kubernetes. Designed and shipped a GitOps delivery platform end to end — a multi-node cluster with load-balanced ingress, an automated CI/CD pipeline with security scanning and container image publishing, continuous delivery with automated self-healing, and a full observability stack for metrics, logs, and dashboards. Currently supporting deployment and application monitoring workflows for an enterprise client.

TECHNICAL SKILLS

Languages: Go, Python, Bash/Shell Scripting, SQL

Backend: REST APIs, PostgreSQL

Containers & Orchestration: Docker, Kubernetes

CI/CD : GitHub Actions, ArgoCD, Git

Observability: Prometheus, Grafana

PROFESSIONAL EXPERIENCE

Executive – Client Project

Oct 2025 – Present

Quess Corp Limited (Client Deputation), Gurgaon

- Supporting client-side technology operations, application monitoring, documentation, and deployment activities.
- Collaborating with technical teams and gaining exposure to production workflows and enterprise delivery processes.

DevOps Engineer Intern

Jul 2024 – Aug 2024

Internship Studio – Remote

- Deployed containerized and web-based applications in cloud-oriented environments.
- Worked on Docker-based backend services and Golang REST APIs.
- Practiced Kubernetes deployments and system-level operational workflows.

PROJECTS

GitOps & Observability Kubernetes Platform | [Repository](#)

- Provisioned a **3-node cluster** (1 control-plane, 2 workers) with an NGINX Ingress Controller pinned to the control plane via tolerations and ingress-ready node labels.
- Instrumented a Go microservice with Prometheus RED metrics and health probes, shipped in a **6.45 MB** multi-stage Docker image running as **non-root (UID 10001)** with a **read-only root filesystem**.
- Packaged workloads as a parameterised Helm chart covering resource limits, **HPA autoscaling**, and a dynamic Service-Monitor CRD so monitoring config ships with the service.
- Automated CI in GitHub Actions with schema validation, linting, build checks, Trivy CVE gating, GHCR image publishing, and automated image-tag commits back into **values.yaml**.
- Delivered continuous deployment via ArgoCD with **automated self-healing**, verified by drift-correcting manual scaling changes against the Git source of truth.
- Deployed a full monitoring and logging stack, auto-provisioning a RED metrics dashboard and log data source into Grafana via sidecar ConfigMaps.

Book Inventory REST API | [Repository](#)

- Built a full CRUD REST API in Go with the Gin framework, exposing **5 endpoints** to create, list, fetch by ID, update, and delete book records.
- Modelled data with GORM over PostgreSQL, externalising database credentials through dotenv for **zero hardcoded credentials**.
- Structured the codebase into **4 decoupled layers** — controllers, models, routes, and database — to separate request handling, business logic, and persistence.

EDUCATION

SRM University

2020 – 2024

Bachelor of Technology in Computer Science and Engineering — CGPA: 7.8
